

Total Purity Solutions

Windfarm Platform Service for Transformer- and Substations

Safe work at substations: Fluidcarrying systems are cleaned on site.

Manned and un-manned substations are dependent on functional sewage, fresh water, and drainage systems. Cleaning and preventive maintenance of these systems are offered based on hygienic and environmental issues.

Fluid Transfer System Service Concept

Ocean Team offers a unique liquid transfer package:

- Turn-key solution rinsing drain/sewage systems (CIP)
- Turn-key solution disinfecting fresh water systems (CIP)
- Total clean-up of diesel systems exposed to water bacteria (mechanical and chemical)
- On-site oil analysis program

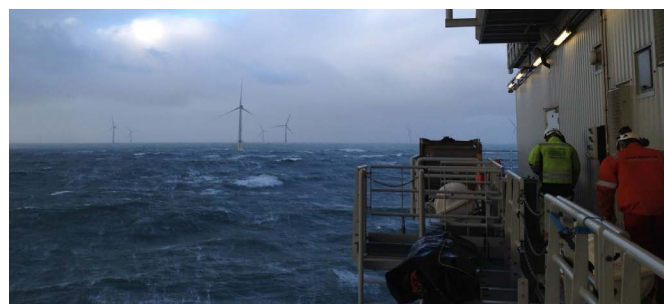

Diesel generators, fuel systems, and tanks, may contain contaminated water and consequently experience bacteria growth due to bunkering circumstances, at fluctuating temperatures, salty environment, and unstable operation cycles.

OTW certified offshore supervisors are experienced in safe work in confined spaces and restricted areas, explosive atmospheres (ATEX), or with H₂S gasses. Immediate and reliable system health analysis are enabled by our mobile analysis kit.

Clean Fuel and Water for Offshore Life

Both fuel for power supply or fresh water for human consumption are necessary for daily life, and a precondition for safety at remotely located offshore platforms.
