Cleaning of Drainage Systems Offshore

- By Means of High-pressure Hydro Jetting

The functionality of the drainage systems at offshore installations is an important safety factor - especially when dealing with preventing a fire from spreading.

Steel cable ties, sandblasting sand, various cloths as well as deposits from remains of chemistry, oil and wax. These are examples of unwanted contaminations, which get into the drainage system and in time either reduce the flow capacity or risk to totally block the drain pipes.

Effective Clean-Up & Preventive Maintenance

By means of high-pressure hydro jetting, Ocean Team is able to clean heavily contaminated drainage systems as well as perform preventive maintenance of your systems.

We operate with a wide range of special nozzles, which enable us to clean-up all kinds of blockages or deposits you may face in your drainage systems.

Drain Inspection System

Get a quick view of the shape of your drain with our mobile video inspection system.

The system makes it possible to look inside the drain and identify exactly what causes the reduced functionality and where the problem is situated. This enables us to take action toward the specific problem giving you a faster and more effective cleaning.

"Do You Dare to Wait for Your Drainage Systems to Fail...?"

...before taking action? Preventive maintenance of drainage systems results in increased safety, reduced maintenance costs and eliminated risks of production loss as a result of a blocked drain pipe.
