

Total Purity Solutions

Conventional Oil Flushing

- with pulsed and turbulent flow-conditions

Turbulent flow purifies the system, and eliminates the source of future contamination.

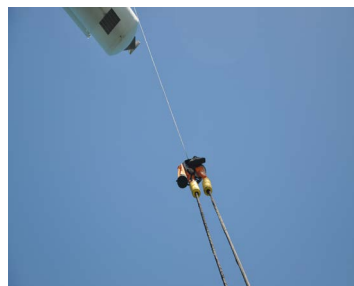

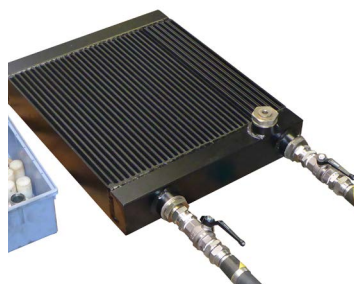

Hydraulic and lubrication systems are very diverse, both in size and complexity. However, thanks to many years of experience, Ocean Team Windcare has designed and developed a wide program of flushing technologies, methods and units capable of meeting the ever-increasing requirements on cleanliness of components and system suppliers.

Advantages

- Totally clean and reliable system
- Minimization of maintenance costs
- Minimization of system failures and breakdowns
- Extended system life time

Efficient Flushing with Turbulent Flow

Oil flushing is more than just circulating oil through a system. An efficient flushing requires turbulent flow in order to dislodge impurities deposited on the inside of the system.

"Flushing Keeps Your Systems Stronger for Longer"

Oil filtration cleans the oil but not the system, whereas flushing using turbulent flow purifies the system.
